

### **AMENDMENTS TO THE CLAIMS**

1. (Currently amended) 1. An automatic system for providing information and images comprising:

a moving image advertising monitor for displaying moving images advertising products and information of chain stores selling the products, wherein the moving images are provided from a server through a telecommunication network;

a moving image advertising touchscreen for operating the moving image monitor;

a text advertising monitor for displaying advertising information of network products and chain stores selling the products, wherein the advertising information is stored in a [[wide]] disk;

a text advertising touchscreen for operating the moving image monitor and for including various icons for enabling the printing of coupons of specific network products and coupons offered by chain stores selling the products;

a [[wide]] disk driver for providing advertising images to the text advertising monitor and outputting a coupon print signal for printing coupons of network products and coupons offered by chain stores selling the products after advertising information is searched by a user operating the text advertising touchscreen;

a terminal system main body for providing advertising images to the moving image advertising monitor and outputting a coupon print signal for printing coupons of advertising products and coupons offered by chain stores selling the products after advertising information is searched by a user operating the moving image advertising touchscreen, and also providing shopping and general information and search images of this information as a touchscreen switch of the text advertising touchscreen is controlled to On, and outputting a shopping and general information print signal; and

a printer for receiving the coupon print signal and shopping and general information print signal from the [[wide]] disk driver and the terminal system main body, and performing a corresponding print operation.

2. (Original) The system of claim 1 wherein the terminal system main body provides search images of chain stores and products sold by the chain stores to a touchscreen monitor, and if the touchscreen switch of the text advertising touchscreen is controlled to On, outputs a coupon print signal for printing a coupon.

3. (Original) The system of claim 1 wherein the terminal system main body is connected to a server via the communication network to establish a multi-image advertising network, the server having a database of advertising information and shopping and general information displayed on the moving image advertising monitor and the text advertising monitor.

4. (Original) The system of claim 1 wherein the terminal system main body displays the advertising information displayed on the moving image advertising monitor simultaneously on the text advertising monitor up until the text advertising touchscreen is controlled to On.

5. (Currently amended) The system of claim 1 wherein the [[wide]] disk driver displays the advertising information displayed on the text advertising monitor simultaneously on the moving image advertising monitor if communications between the terminal system main body and the server are cut off.

6. (Original) The system of claim 1 wherein the printer prints coupons of advertising products and chain stores selling the products displayed on the moving image advertising monitor and the text advertising monitor, and selected shopping and general information displayed on the text advertising monitor.

7. (Original) The system of claim 1 wherein a pager phone is connected to the terminal system main body.

8. (Original) The system of claim 1 wherein a DVD for providing images is connected to the terminal system main body.

9. (Original) The system of claim 1 wherein one or more of a receipt vender, a public telephone card vendor, a public transportation card vendor and re-charger, and a credit card vendor is provided in the terminal system main body.

10. (New) An automatic system for providing information and images comprising:

a first advertising monitor for displaying moving images advertising products and information of chain stores selling the products, wherein the moving images are provided from a server through a telecommunication network,

a second advertising monitor for displaying advertising information of products and chain stores selling the products, wherein the advertising information is stored in a disk;

a touchscreen including various icons for enabling the printing of coupons of specific products and coupons offered by chain stores selling the products;

a disk driver for providing the advertising information to the second advertising monitor;

a terminal system main body for providing the moving images from the server through the telecommunication network to the first advertising monitor and outputting a coupon print signal for printing coupons offered by chain stores selling the products; and

a printer for receiving the coupon print signal and performing a corresponding print operation.

11. (New) The system of claim 10, wherein the disk driver displays the advertising information displayed on the second advertising monitor simultaneously on the first advertising monitor if communications between the terminal system main body and the server are cut off.
